Problem:

Electronic Document Delivery system of Health Literature, Library Information Service (HeLLIS) Network is not adequate to fulfill users' information needs in time

Scope of this study:

To develop a Content Management System

Objectives:

To determine the extent of use of medical information, barriers to use and use of computers and electronic information by health professionals

Method:

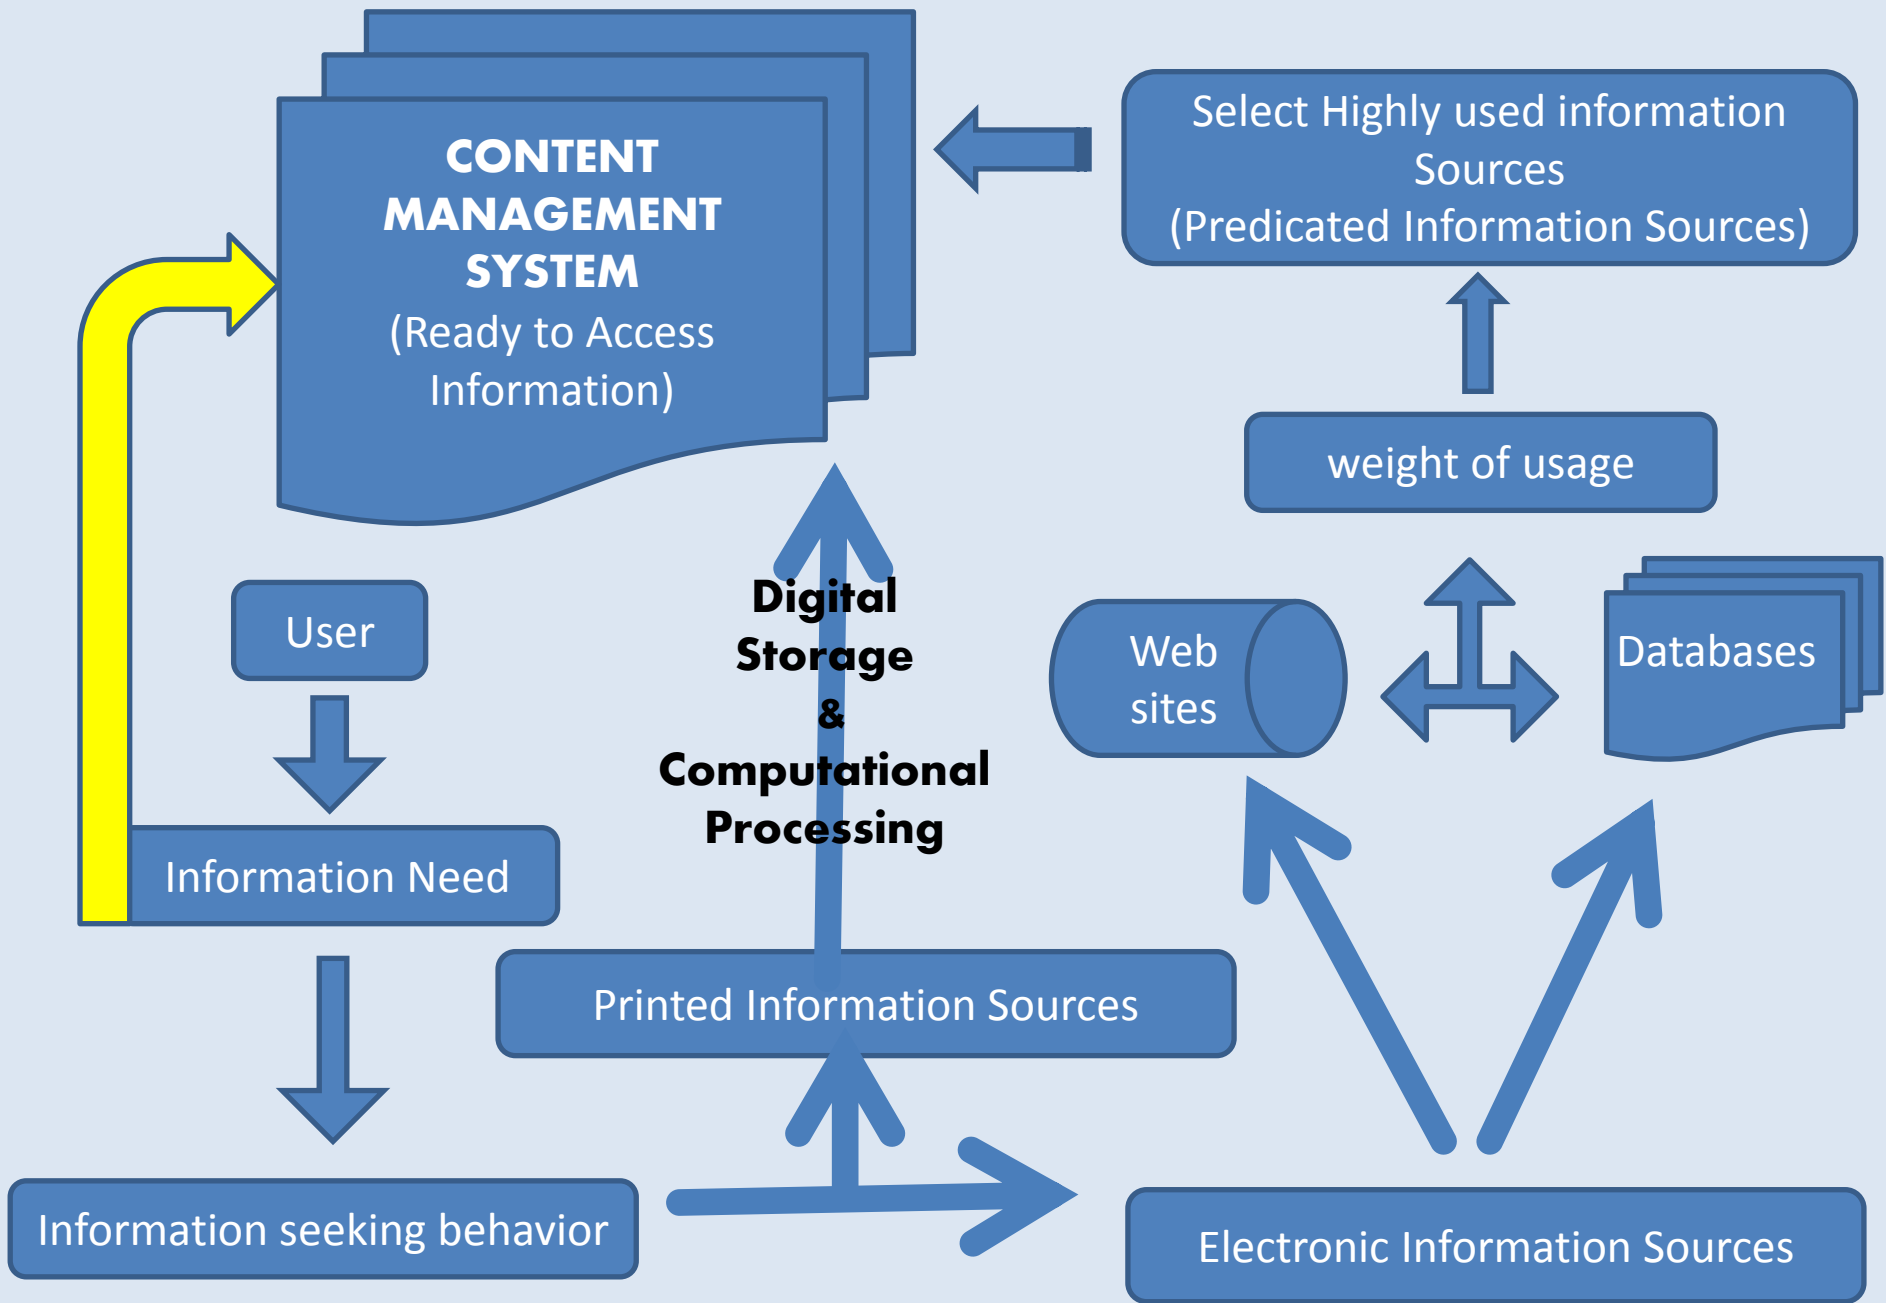

The survey instrument: a five point type questionnaire to bring about opinions from the health care users.

Finding:

- Electronic resources are heavily used rather than printed resources.
- Training is still required in some extent.
- One platform is preferred to navigate for heavily used medical literature published in local & international .
- Emphasized value of designing of virtual knowledge dissemination services in Sri Lanka. The platform expects search and retrieval functionalities that enable users to work effectively in the knowledge discovery process .

Conclusion:

Librarians should have now realized, providing information available in the library does not adequate. They should initiate selecting & organizing knowledge resources vis-à-vis users' informational needs, by holding a strong position in supporting information access for their users. The provision of instruction manual or necessary training would be available as its' promotional material..
